Professional Summary

Senior Cloud Engineer with 7.5+ years of experience building automation platforms, cloud-native applications, and secure CI/CD pipelines across enterprise environments. Strong expertise in Python-based automation, Infrastructure as Code using Terraform, containerized application deployment, and integrating application security tools within modern DevSecOps workflows. Experienced in designing scalable cloud infrastructure, automating security testing pipelines, and integrating security platforms using REST APIs. Proven ability to work across engineering, security, and operations teams to deliver secure, reliable, and highly automated cloud solutions.

Core Technical Skills

Cloud Platforms: AWS (Lambda, ECS, ECR, API Gateway, S3, DynamoDB, CloudWatch, VPC, Route53), Azure

Infrastructure as Code: Terraform, Infrastructure automation, modular IaC architecture

Programming: Python, PowerShell

Containers: Docker, containerized application deployment, AWS ECS

CI/CD: GitHub Actions, Jenkins, AWS CodeBuild

DevSecOps: DevSecOps automation, OWASP practices

Security Tools: Snyk, SonarQube, API-based security integrations

APIs: REST APIs, microservice integrations

Databases: SQL Server, MySQL, MongoDB, DynamoDB

Monitoring: AWS CloudWatch, logging pipelines

Data Tools: Pandas, NumPy, Power BI

Professional Experience

Senior Engineer – Cloud Engineering | HCLTech

- Designed and developed automation platforms using Python to support large-scale enterprise cloud environments.
- Developed cloud automation scripts integrating multiple APIs and services across cloud platforms.
- Built cloud cost optimization analytics platforms that analyze resource utilization and generate actionable recommendations.
- Implemented CI/CD automation pipelines integrating build, test, security scanning, and deployment workflows.
- Designed secure automation solutions that integrate security checks into development pipelines.
- Developed operational automation tools for infrastructure monitoring, reporting, and cloud governance.
- Collaborated with cross-functional teams including engineering, security, and operations to deliver scalable automation platforms.

Application Security

- Integrated security scanning tools such as Snyk (SCA) and SonarQube (SAST) into automated CI/CD pipelines.
- Implemented secret detection using TruffleHog to prevent credential exposure in source code repositories.
- Automated security testing workflows as part of continuous integration pipelines.
- Built Python-based automation scripts that interact with security platform APIs.
- Designed secure DevSecOps workflows aligned with OWASP secure development practices.
- Implemented automated security gates within CI/CD pipelines to enforce secure software delivery.

Automation Platform (AWS + Terraform)

- Designed a cloud-native DevSecOps platform that orchestrates application security testing across CI/CD pipelines.
- Provisioned AWS infrastructure using Terraform including Lambda functions, ECS services, API Gateway, DynamoDB, S3, and CloudWatch.
- Implemented infrastructure modules enabling automated multi-region deployments.
- Built Python automation services that integrate security tools via REST APIs.
- Implemented Docker-based containerized workloads deployed to AWS ECS.
- Developed CI/CD pipelines using GitHub Actions and AWS CodeBuild to automate build, security scans, and deployments.

- Integrated application security tools including Snyk (SCA), SonarQube (SAST), and secret scanning tools into the pipeline.
- Stored security scan results and metadata in DynamoDB and generated monitoring alerts via CloudWatch.

Cloud Cost Optimization Platform

Built a Python-based analytics and automation platform that analyzes enterprise cloud usage data and generates cost optimization insights across compute, storage, and platform services.

Backup Failure Prediction System

Developed a machine learning-based prediction platform that analyzes historical backup job data and predicts potential failures, enabling proactive operational response.

AI Knowledge Retrieval System

Developed a retrieval-based AI system using vector databases and LLM integrations to enable intelligent question answering across enterprise knowledge repositories.

Certifications

Microsoft Certified: Azure Data Engineer Associate

Availability

Cloud engineering roles including infrastructure automation, security platform integration, and CI/CD security implementation.
